The CMS collaboration has reported results on the SM Higgs hypothesis at √s = 7 TeV, L = 5.1 fb⁻¹ and √s = 8 TeV, L = 5.3 fb⁻¹. The observed CLs of the SM Higgs hypothesis are shown in the plot, with 95%, 99%, and 99.9% confidence levels. The expected CLs (68% and 95%) are also included. The plot shows a peak around m_H = 125 GeV, indicating the expected mass of the Higgs boson according to the SM.
