The CMS experiment has presented data on the ratio of data to theory, with an uncertainty analysis for experimental, theoretical, and PDF uncertainties. The plot shows the data points and theoretical curves for the jet $p_T$ distribution with CMS data and their respective uncertainties. The analysis covers the rapidity range $0.5 \leq |y| < 1.0$. The data is compared to the CT10 NLO × NP predictions. The data presents a good agreement with the theory within uncertainties.
