The figure shows the L1+HLT efficiency as a function of $p_T^{\tau_h}$ (GeV) for observed and simulated data. The CMS experiment used 8.6 fb$^{-1}$ of data taken in 2016 at 13 TeV. The observed data is represented by black downward triangles, and the simulated data by red upward triangles. The $h\tau$ and $\tau_h\tau_h$ channels are indicated in the plot.
